

NEW WAVE OF THE UOO ABOVE POLAND

By Robert K. Lesniakiewicz

At the end of 1990s, Polish ufologists entered a new category to the J. Allen Hynek's UFO classification. They are two another sorts of the Nocturnal Lights: *NL/UOO – Unknown Orbital Object* and *NL/UCO – Unknown Cosmic Object*. It was caused by many sightings of the star-like objects, which had been reported from various parts of Poland in a period between 1994- 2000. In fact, it was the first wave of the strange lights, which had been watched by many people and even filmed and photographed by them. I must add that those lights were not recognized as meteors, planes, balloons, helicopters, satellites, shuttles or space stations: *ISS Alpha* and *Mir*. Their behavior was similar to the satellites' one, however those 'lights' moved very much higher than them – far beyond a cone of the Earth's shadow and sometimes very much faster than the satellites and spacecrafts.

In my books titled *UFOs Above the Border* (Krakow 2000) and *Project Tatra* (Krakow 2002) I gave almost 50 samples of such sightings. After year 2000 we had a break in those kind of observations. They started appear again in the terribly hot Summer 2003 a . D. And I am going to give to Readers my short report on several NL/UOO and NL/UCO, which were seen by myself and my fellows from the Center for the UFO and Anomalous Phenomena Researches in Krakow – CBUFOiZA.

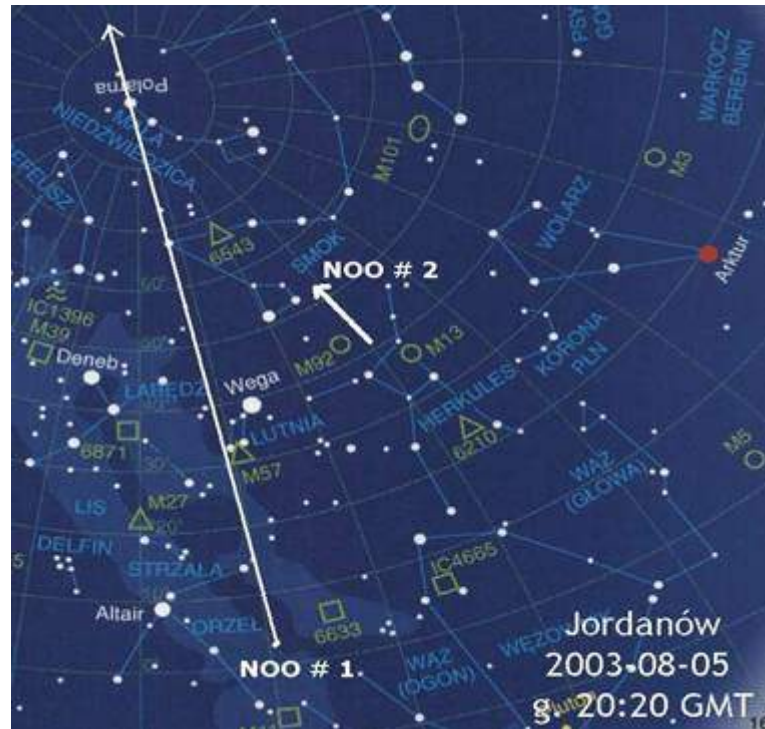

The first registered by the CBUFOiZA such sighting took its place in the circumstances of the New York city! It occurred in Jun. 28th, 2003 at 23:45-23:47 hrs of the local time. Two witnesses – **Mr. Mrs. Krzysztof and Barbara P.** drove their car on a highway. They noticed in a dark sky strange oval-shaped object, which moved slowly towards a center of the New York city. They were between Brooklyn and Queens. The UFO was elliptic and white-blue in its color, with white and red lights on its circumstance. Personally I think that this relation is very important in a context of events, which played themselves in August this year in NY. Many people in Europe think that the electric blackout, which hit NY in Aug. 14th, was

caused by UFOs – such like the one, which had taken its place on Jul. 13th, 1977.

By the way, my sister **M. of A. Wiktoria Lesniakiewicz** saw two strange lights from a balcony of a hotel in Mombassa, Kenya, on Aug. 13th. They went towards the Indian Ocean. She thought that they had been satellites only. She changed her mind, when she got to know about the NY blackout on a board of a plane from Mombassa to Munich, Germany. Now she thinks that they might be UFOs... After her return to Poland, she has made an analysis of the blackouts in the America and Europe in our article titled *The CANUSE Failure – The Extra-Terrestrial Terrorists?*, where we described the troubles with electricity in USA, Mexico, Canada, Argentina, United Kingdom, France, Germany and Poland in a period between 1950 and 1985. Moreover we quoted an article taken from the magazine *Kaleidoscope of the UFOs* of St. Petersburg, Russia saying about the Azerbeidjan blackout, which had occurred in 2002 and Georgian one, which had taken its place three days after the one in NY and Ottawa.

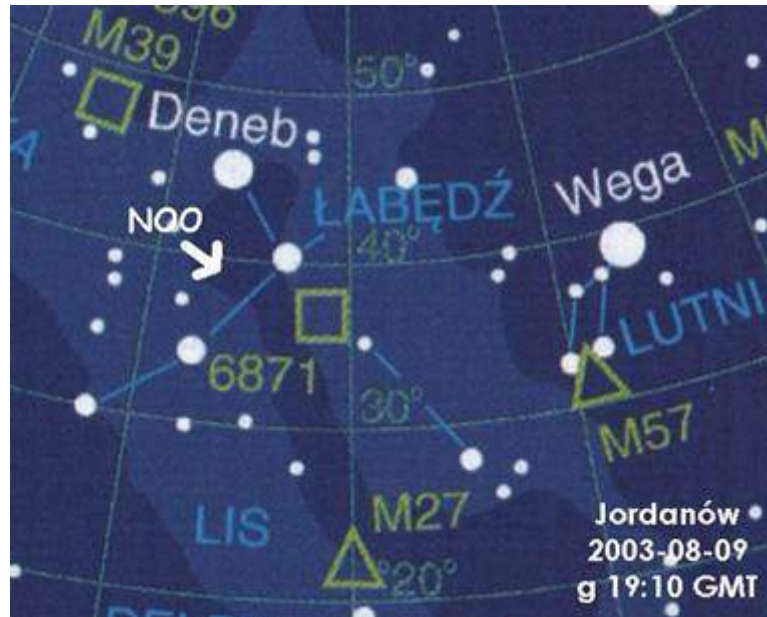

The second NL/UOO-sighting we registered two days after the NY-incident – on Jun. 30th 2003 in the Myslenice town. One witness **Mr. Krzysztof D.** saw a very strong light in the sky. It was a star-like object, which moved very slowly from South to North, at the midnight. It could not be any satellite or any other human device. Its trajectory could not be compared to any known satellites' orbits...

On Aug. 5th, we registered the third UOO-sightings. At 20:20 UT, I noticed a strange “star”, which moved from South to North.

It went towards the North Pole through constellations of Eagle, Swan, Lyra, Dragon and Little Bear, where it finally disappeared. In two-three minutes later, I noticed another star in a northern part of the Hercules constellation. It was very much stronger than the first one and went also toward the North Pole. Suddenly it decreased its light and vanished in the Dragon constellation, nearby the star of Thuban.

The next such event was four days later – on Aug. 9th, at 19:10 UT. In that time I saw together with my colleague **Major Ret. M. of T. Waclaw D.** a very bright star, which had appeared in a constellation of the Swan.

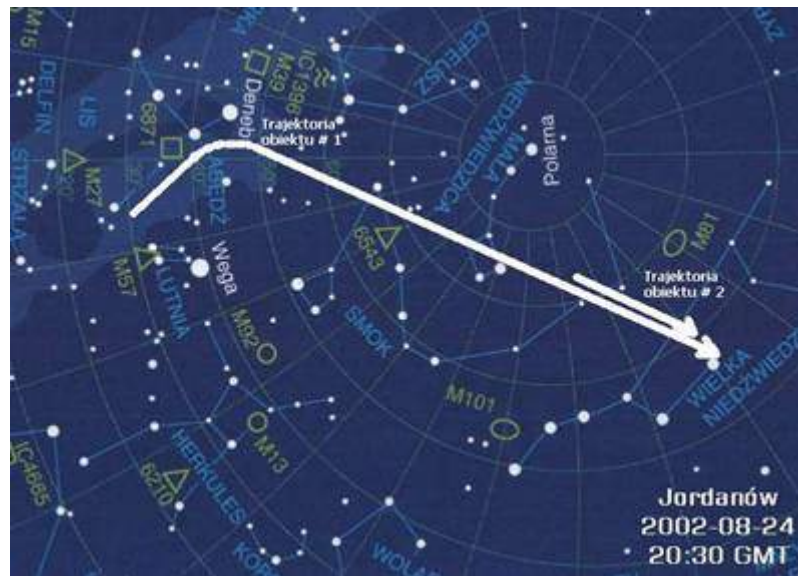

The “star” shone 2-3 seconds and went off. We think that it was a meteor, which burnt itself in the upper layers of the Earth’s atmosphere. It went almost strictly towards us and we saw it as a bright “star”.

Aug. 26th, at 19:29 UT, I saw myself a strange thing from a kitchen window of my house. It was a very strong flash of orange light nearby a star of the Altair in the Eagle constellation. That “star”, which brightness could be greater than the planet Mars’ one, (that means that it was brighter than $-3^m,1$) moved quickly towards the North. In a few seconds it vanished mysteriously as quick as it appeared in the sky!

By the way, it is not the only one event such type. In previous years we have had a lot of these “vanishing stars” sightings in Poland. Now we think that they can be a new, ultra-secret type of the satellites used either by Americans or Russians or China, Japan and even Korea or India! The last events in the Alcantara AFB, Brazil, where the rocket VLS-3 exploded on Aug. 24th point to us that also poorer countries could send their spacecrafts on the orbit... So then, we could see such secret spacecrafts made in China, Brazil or India. There were rumors that even Iraq dictator **Saddam Husain** wanted to have his space program, beside the atom-research one!

On Aug. 24th, at 20:30 UT, I experienced another strange UOO sighting. I noticed a mobile light, which moved from a neighborhood of the Albireo

star towards the Gamma Cygni. Suddenly the light made a 90-degrees turn to right and went on the new trajectory to the North Pole. It disappeared between two stars of the Great Bear constellation. In two minutes, I noticed another strong light, which appeared among stars of the Draco constellation and followed the first UFO. It vanished like the first light in the Great Bear...

The last sighting we had on Aug. 27th, at 21:45 UT. My sister, her friend Mrs. Malgorzata N. and me watched the planet Mars during its Great Opposition. At that time, I decided to show to both ladies the Great Galaxy of Andromeda (M-31). We used a telescope 20x and 40x. I aimed my telescope at the M-31 and watched it. Suddenly, a small shining object ran across a field of my sight from North to South.

Firstly we thought that we had seen a satellite. But I do not think so now. If it were the satellite, it have had to be far, far beyond a cone of the Earth shadow. Its speed was very high and I think that we saw either meteor or something, which had moved with tremendous speed – above 20 km/s!

In this picture we can see Moon and Mars. That photograph was made on Aug. 13th, when Moon was in a conjunction to Mars. Many people phoned to the CBUFOiZA and reported seeing *the Great, red UFO, which is coming to Moon's equator*. Two years ago we had such trouble with Jupiter, which approached to the South Pole of the Moon. And in that time, many people made calls to us with such information. But trained watchers can very easy recognize the planets, IFOs and UFOs – and do not make any disinformation. I do not really know, what were those objects, which had been watched in June and August this year. They were neither planets nor another natural celestial bodies. The only one possibility is either the secret human or an open Alien activity in space. And there is no third way out!...

Jordanów, Aug. 30th, 2003
